What is Agentic RAG?

Agentic RAG (Retrieval-Augmented Generation with agents) refers to an advanced framework where intelligent agents dynamically orchestrate the RAG process. Unlike standard RAG, which statically retrieves documents and passes them to a language model, Agentic RAG uses agents (autonomous reasoning components) to:

- Decide what to search for
- Iteratively refine queries
- Use retrieved knowledge in multi-step reasoning
- Possibly use tools (APIs, calculators, databases) along the way.
